Dear Partners!

On behalf of all the members in NON, we do appreciate all your efforts for successful launch of our brand Dr. Clo in Malaysia.

Regarding your inquiry about “effective day (duration)” of each Dr. Clo stick, I would like to highlight that it strictly depends on surrounding environment after activating the stick.

As you know by now, ClO₂, in nature, is highly vulnerable and sensitive to “Temperature” and “Sunlight”. Therefore, in order to enjoy the maximum effective days of 50 days or more after activating Dr. Clo stick, it should be placed where you can avoid direct contact of sunlight and high temperature. If you fail this proper usage, the effective days of each Dr. Clo stick may be shorten to less than 30~40 days. Even if Dr. Clo stick turns white, it doesn't mean that being completely non-functional, but the concentration of Chlorine dioxide in the product is being reduced little by little.

Due to the character of ClO₂ above, other products made of liquid base materials have extremely short effective days by the high temperature and direct sunlight, while our product Dr. Clo has developed to cover this vulnerability of ClO₂ by cutting edge technology.

We hope all your personnel and involving partners should be well noted above.

Sincerely,

NON Corporation
